

PROCESS FOR SEPARATING MIXTURES OF HYDROCARBON ISOMERS IN GAS PHASE ON MOLECULAR SIEVES

Abstract

Process for separating mixtures of hydrocarbon isomers in gas phase on molecular sieves characterized in that it comprises the following steps:

- (a) feeding the mixtures of hydrocarbon isomers to a column, or several columns, having the function of primary adsorption column, wherein part of the isomers with a greater selectivity towards the molecular sieves, are adsorbed;
- (b) feeding the effluent from the primary adsorption column(s) to a column, or several columns, having the function of secondary adsorption column, wherein the remaining part of the isomers with a greater selectivity towards the molecular sieves, are adsorbed, and from which a stream is discharged containing isomers with a lower selectivity towards the molecular sieves, and the desorbing agent already present in the column;
- (c) feeding the desorbing agent to a column, or several columns, having the function of desorption column, from which a stream is discharged containing the isomers with a greater selectivity towards the molecular sieves, and the desorbing agent itself;
- (d) feeding the stream containing the isomers with a lower selectivity towards the molecular sieves, and the desorbing agent, leaving the column(s) having the function of secondary adsorption column, to a distillation unit for the recovery of the desorbing agent to be recycled to the column(s) having a desorption function
- (e) feeding the stream containing the isomers with a greater selectivity towards the molecular sieves and the desorbing agent, leaving the column(s) having the function

of desorption column, to another distillation unit for the recovery of the desorbing agent to be recycled to the column(s) having a desorption function

steps (a) , (b) and (c) being effected by means of three phases and a number of three or a multiple of three columns having fixed molecular sieve beds, so that from one phase to another, these columns pass alternatively in sequence from functions of secondary adsorption column to functions of primary adsorption column, to functions of desorption column.
